A Conjugate Gradient Algorithm For

In mathematics, the conjugate gradient method is an algorithm for the numerical solution of particular systems of linear equations, namely those whose matrix is symmetric and positive-definite. The conjugate gradient method is often implemented as an iterative algorithm , applicable to sparse systems that are too large to be handled by a direct implementation or other direct methods such as the Cholesky decomposition .

Conjugate gradient method - Wikipedia

In this paper, a modified conjugate gradient method is designed that has a sufficient descent property and trust region property. It is interesting that the formula for search direction makes full use of the property of convex combination between the deepest descent algorithm and the classical LS conjugate gradient (CG) method.

Preconditioned conjugate gradient algorithm • idea: apply CG after linear change of coordinates $x = Ty$, $\det T \neq 0$
• use CG to solve $TT^T y = TT^T b$; then set $x^* = T^{-1}y^*$ • T or $M = TT^T$ is called preconditioner • in naive implementation, each iteration requires multiplies by T and TT^T

In this paper, a three-term conjugate gradient algorithm is developed for solving large-scale unconstrained optimization problems. The search direction at each iteration of the algorithm is determined by rectifying the steepest descent direction with the difference between the current iterative points and that between the gradients.

A three-term conjugate gradient algorithm for large-scale ...

The conjugate gradient method is a mathematical technique that can be useful for the optimization of both linear and non-linear systems. This technique is generally used as an iterative algorithm, however, it can be used as a direct method, and it will produce a numerical solution.

The Conjugate Gradient Method is the most prominent iterative method for solving sparse systems of linear equations. Unfortunately, many textbook treatments of the topic are written with neither illustrations nor intuition, and their victims can be found to this day babbling senselessly in the corners of dusty libraries.

Our over- all goal in developing the conjugate gradient algorithm is to construct consecutive search directions that meet condition (5) without explicit computation of the large Hessian matrix (H).

Conjugate gradient algorithm for training neural networks

The conjugate gradient algorithm is increasingly famous because of its simplicity and low requirement of calculation machine. In general, a good conjugate gradient algorithm optimization algorithm includes a good conjugate gradient direction and an

The conjugate gradient approach begins in the same manner, but diverges from steepest descent after the first step. In subsequent steps, the direction of travel must be conjugate to the direction most recently traveled. Two vectors u and v are conjugate with respect to the matrix A if $u'Av = 0$.

3.4 Conjugate Gradient | Advanced Statistical Computing

The conjugate gradient method is a conjugate direction method ! Selects the successive direction vectors as a conjugate version of the successive gradients obtained as the method progresses. ! The conjugate directions are not specified beforehand, but rather are determined sequentially at each step of the iteration.
