Within a common rail diesel system, the Engine Control Module (ECM) uses a pressure regulator valve to control the fuel pressure within the common rail. When the ECM needs to reduce the pressure, the valve is opened and excess fuel is released to the fuel return system. Conversely, when an increased pressure is needed, the valve is closed.

### CRD (Bosch) pressure regulator valve

The pressure control valve (PCV, PCVN) sets the system pressure supplied by the control unit in the rail. The pressure limiting valve (PLV) reduces the system pressure in case of overload and thus protects the other injection components from damage. The job of the fuel control valve is to maintain a constant pressure in the common-rail fuel rail. When the rail empties, the valve shuts and allows fuel from the high pressure pump to fill the rail again. As the rail fills to maximum, the valve opens to allow fuel to escape back to the vehicle's fuel storage tank.

Output drivers in the control module provide the pump control circuit with a 12 V pulse-width modulated (PWM) signal, which regulates fuel pressure by closing and opening the control valve at specific times during pump strokes. This effectively regulates the portion of each pump stroke that is delivered to the fuel rail.
