Saturn's rings come from, or why galaxies have their distinctive shapes? Observational astronomy excels at imaging and cataloging celestial objects, but it takes a more rigorous discipline to come up with physical explanations for them. That field is astrophysics.

Introduction to Astrophysics - The Great Courses

An Introduction to
Stars At its simplest, a
star is nothing more
than a ball of gas,
mostly hydrogen and
helium, contracting
under the force of
gravity and releasing
gravitational and fusion
energy into space. At
the beginning of its life,
a star releases only
gravitational potential
energy.

Hipparchos and Ptolemy (≈ 150 B.C.) divided stars into six classes of brightness, called (apparent) magnitudes m : Stars with $m = 6$ were the faintest objects visible by eye, stars with $m = 1$ the brightest stars on the sky. Thus the magnitude scale increases for fainter objects, a counter-intuitive fact that should be kept in
