A photovoltaic power station, also known as a solar park or solar farm, is a large-scale photovoltaic system (PV system) designed for the supply of merchant power into the electricity grid. They are differentiated from most building-mounted and other decentralised solar power applications because they supply power at the utility level, rather than to a local user or users.

The system would be considered a device that exceeds 100 kW and therefore could be eligible for LGCs under the Large-scale Renewable Energy Target. This system would not be eligible for STCs under the Small-scale Renewable Energy Scheme. Scenario 7: Two retail complexes are on adjacent properties, each connected to the grid via a separate NMI.

Defining small scale and large scale solar systems

A solar farm, sometimes referred to as a photovoltaic power station, is typically a large decentralized solar array supplying electricity to the power grid. The majority of these massive arrays are owned by utilities and are merely another asset for the utility to supply power to properties in their coverage area.
