Perinatal Asphyxia

Perinatal asphyxia, or birth asphyxia, results from an inadequate intake of oxygen by the baby during the birth process — before, during or just after birth. Decreased oxygen intake can result in chemical changes in the baby's body that include hypoxemia, or low levels of oxygen in the blood, and acidosis, in which too much acid builds up in the blood.

Perinatal Asphyxia | Johns Hopkins Medicine

Perinatal asphyxia (also known as neonatal asphyxia or birth asphyxia) is the medical condition resulting from deprivation of oxygen to a newborn infant that lasts long enough during the birth process to cause physical harm, usually to the brain. It is also the inability to establish and sustain adequate or spontaneous respiration upon delivery of the newborn.
